ARAMAM LOGO

PROPOSAL · DIGITAL TRANSFORMATION OF OPERATIONS & FINANCE

Run the whole group on one system.

Microsoft Dynamics 365 Business Central for Aramam — outlet inventory and procurement, recipe-driven consumption from POS, and a finance function that closes on time.

Prepared for Aramam Restaurants

Prepared by Gerab System Solutions · September 2026

AGENDA

What we will cover

Roughly thirty minutes, then discussion. Stop us wherever it is useful.

- | | | |
|-----------|------------------------------|---|
| 01 | Who we are | Gerab System Solutions — what we do and who we do it for. |
| 02 | Where Aramam is today | The current operating and finance setup, and what it costs. |
| 03 | Why Business Central | The platform, and why it fits a growing restaurant group. |
| 04 | The three focus areas | Inventory & procurement · Recipe & consumption · Finance & MIS. |
| 05 | Compliance and scale | VAT, e-invoicing readiness, and the cloud kitchen. |
| 06 | How we deliver | Roadmap, responsibilities and next steps. |

WHO WE ARE

Gerab System Solutions

We are a UAE-based enterprise technology company. We design, implement and support the business systems that groups like yours run on — ERP, Microsoft 365 and SharePoint, Power Platform and business intelligence, infrastructure and cloud, and the managed support that keeps all of it running afterwards.

We are a Microsoft partner with delivery experience across construction, trading, manufacturing and services businesses in the UAE — the same operating realities as a multi-outlet restaurant group: many locations, tight margins, and a finance team that needs the numbers early.

Microsoft partner

Dynamics 365, Microsoft 365 and Azure.

Single accountable partner

Licensing, implementation and support in one contract.

UAE-based delivery

Local consultants, local hours, on-site when it matters.

Post go-live support

Managed services and an AMS desk after hypercare.

What we deliver

One partner across the stack — so the ERP, the reporting layer and the infrastructure underneath are not three different conversations.

ERP — Dynamics 365 Business Central

Finance, inventory, purchasing, production and projects on Microsoft's cloud ERP.

Microsoft 365 & SharePoint

Document management, records, intranet and collaboration.

Power Platform & BI

Power BI dashboards, Power Apps forms and Power Automate workflows.

Cloud & infrastructure

Azure, networking, servers and backup — designed, migrated and managed.

Security

Identity, access control, endpoint and email security.

Managed services & support

AMS desk, enhancements and version upgrades after go-live.

SELECTED CLIENTS

Delivered in production, across sectors

Portals, document management, workflow and business systems for organisations that cannot afford downtime.

CLIENT LOGO VIVA AVIATION	CLIENT LOGO AAB DIVERSIFIED GROUP	CLIENT LOGO ASCO DISTRIBUTION	CLIENT LOGO Corporate Group Portal TRADING / SERVICES

How a sale becomes a number today

As we understand it from our discussions. Correct us where we have it wrong — the detail matters.

Meanwhile, off the system entirely

- Purchases, GRNs and supplier prices tracked on spreadsheets and messages
- Outlet-to-outlet transfers agreed informally, rarely recorded
- Recipes and portion costs held in people's heads, not in a system
- Closing stock arrived at by count and estimate, not by movement

THE PROBLEM

Six things this setup cannot do

None of these are people problems. They are what happens when a group's operations run on manual consolidation and a desktop ledger.

You find out a month late

Sales reach finance as a monthly summary. By the time a problem is visible in the books, the month that caused it is already closed.

Every number is typed twice

Manual re-entry into Tally is slow, error-prone and unauditible — and it rests on one person. That is a single point of failure for the entire group.

Stock visibility stops at the outlet door

There is no live group-wide stock position, no controlled transfer between outlets, and no reliable answer to "what do we actually hold right now?"

Buying without control

No requisition-to-PO-to-GRN discipline, no approved supplier price lists, no price history — so purchase price creep goes unnoticed.

Food cost is estimated, not measured

Without recipes linked to POS sales, theoretical consumption cannot be calculated — so wastage, over-portioning and pilferage stay invisible.

Reporting is a monthly craft project

MIS is rebuilt by hand in Excel each month. Outlet-wise profitability, on demand, is not currently possible.

And this is the base you are about to scale

A cloud kitchen adds a production location, new SKUs, new transfer routes and new delivery-channel revenue — on top of a process that is already manual.

~30 days

between a sale happening and a reviewed, posted number

1 person

carrying the group's ledger — a single point of failure

0

live, system-held stock positions across outlets

Unmeasured

food cost variance — no theoretical vs actual to compare

Compliance is tightening

The UAE is moving to mandatory e-invoicing. Manual ledgers and offline entry are the wrong starting point for that transition.

Volume is about to jump

New location, new channels, more transactions — the manual month-end does not scale linearly, it breaks.

Decisions run on stale data

Menu, pricing and supplier decisions are being made on numbers that are already a month old.

WHAT GOOD LOOKS LIKE

The same business, running on evidence

Nothing here is aspirational software talk — each row is a specific change in how a day at Aramam works.

	TODAY	WITH BUSINESS CENTRAL
Sales reach finance	Monthly, as a typed summary	Daily, posted automatically from POS
Stock position	Counted, estimated, argued about	Live by outlet, by item, by batch
Buying	Ad-hoc orders, prices unverified	Requisition → approval → PO → GRN → invoice match
Transfers between outlets	Informal, largely unrecorded	Transfer orders with in-transit visibility
Food cost	A number arrived at after the fact	Recipe-driven theoretical vs actual, per dish, per outlet
Management reporting	Rebuilt in Excel each month	Role-based dashboards, refreshed daily

THE RECOMMENDATION

Microsoft Dynamics 365 Business Central

One cloud ERP covering finance, inventory, purchasing and production — not four disconnected tools stitched together with spreadsheets.

MICROSOFT / D365 LOGO

One system, not four

Finance, stock, purchasing and recipe costing share the same data. Post once, see it everywhere.

Cloud, from Microsoft

No servers to buy or patch. Updated twice a year, backed by Microsoft's SLA and security.

Your team already knows it

Native Excel, Outlook and Teams integration. Finance can still work in Excel — on live data.

Built for many locations

Locations, dimensions and inter-company are standard, not bolted on. Adding an outlet is configuration.

Power BI included in the story

Role centres in the app, and full Power BI dashboards for management and owners.

UAE-ready

VAT handling, audit trail and a clear path to the UAE e-invoicing mandate through accredited providers.

Three focus areas, one foundation

These are the three areas you asked us to solve. They are not three projects — they are three views of the same data.

01

Inventory & procurement

- Central store, outlet and cloud-kitchen locations
- Requisition → PO → GRN → invoice matching
- Outlet-to-outlet transfer orders
- Counts, batch and expiry, reorder points

02

Recipe & consumption

- Recipe cards with yield and portion cost
- POS sales mapped to recipes automatically
- Theoretical consumption posted per outlet
- Theoretical vs actual variance and wastage

03

Finance, dashboards & MIS

- Automated posting from sales and purchases
- Outlet-wise P&L through dimensions
- VAT, AP/AR, banking, fixed assets, budgets
- Management dashboards and the monthly MIS pack

Shared foundation: one chart of accounts · dimensions for Outlet, Brand and Cost centre · one item master · approval workflows · user roles and permissions

Inventory and procurement across every outlet

One item master, one stock ledger, and every movement recorded as a transaction — receipts, issues, transfers, wastage and counts.

- Item master with real units.** Purchase in kg, box or crate; consume in grams or portions. Conversions handled once, centrally.
- A location per outlet.** Central store, each outlet and the cloud kitchen are separate locations with their own stock and their own reorder rules.
- Procure-to-pay with control.** Purchase requisition → approval → purchase order → goods receipt → three-way invoice match. Nothing is paid that was not received.
- Supplier price lists and history.** Approved prices per vendor, with variance flagged when an invoice does not match the order.
- Transfer orders between outlets.** Requested, approved, shipped and received — with in-transit stock visible, so nothing disappears between two branches.
- Counts, batch and expiry.** Cycle counts and full physical counts on a tablet; batch and expiry tracking for perishables.
- Reorder points and replenishment.** Minimum and maximum levels per item per location, with suggested purchase and transfer orders.

ONE STOCK LEDGER, FOUR PLACES IT LIVES

Transfer orders move stock between locations with approval and in-transit tracking.

Recipes, and consumption driven by POS

This is the piece that turns food cost from an opinion into a measurement. Every dish sold consumes its recipe, automatically.

Finance that closes, MIS that arrives early

Entries post themselves from the transactions that created them. Finance moves from data entry to review and analysis.

IN THE LEDGER

Automated posting. Daily sales from POS and purchase invoices post to the GL without re-keying.

Dimensions, not sub-ledgers. Tag every entry with Outlet, Brand and Cost centre — outlet-wise P&L becomes a filter, not a rebuild.

AP, AR and banking. Supplier ageing, payment runs and bank reconciliation in one place.

VAT and returns. Tax posting groups configured for UAE VAT, with the return prepared from the ledger.

Budgets vs actual. Budget by outlet and by cost line, compared automatically each period.

Fixed assets. Kitchen equipment and fit-out tracked with depreciation schedules.

Approvals and audit trail. Nothing edits silently — every posted entry traces back to its source document.

THE MONTHLY MIS PACK

Daily sales flash by outlet	Outlet-wise P&L
Food cost % vs target	Dish margin — top and bottom
Purchase price variance	Stock ageing and wastage
AP ageing and cash position	Budget vs actual by outlet

HOW IT FITS TOGETHER

The solution architecture

Your POS stays where it is. Business Central becomes the system of record behind it, and Power BI becomes the window onto both.

Channels

Outlet POS terminals (dine-in & takeaway) · delivery aggregators · cloud-kitchen ordering · catering and events

Integration layer

Scheduled sales import or API connector · menu-item to recipe mapping · aggregator settlement reconciliation · error and exception log

Dynamics 365 Business Central

Finance & GL · Inventory & locations · Purchasing · Assembly / production for recipes · Fixed assets · VAT · Approvals

Insight

Power BI management dashboards · Business Central role centres · refreshable Excel reports · scheduled MIS distribution

Microsoft platform

Azure cloud hosting · Microsoft Entra ID single sign-on and MFA · encryption in transit and at rest · backup and Microsoft SLA

Ready for what the UAE is asking for next

The move to structured, system-generated invoicing is not a reason to change ERP on its own — but it makes a manual desktop ledger an expensive place to be standing.

UAE VAT

Tax posting groups, tax invoice formats and the VAT return prepared directly from the ledger rather than reconstructed.

E-invoicing readiness

Business Central supports structured electronic invoicing and integrates with accredited service providers for the UAE's phased mandate.

Corporate tax ready books

A clean, dimension-tagged audit trail and consistent period close — the foundation any corporate tax computation needs.

A real audit trail

Posted entries cannot be silently edited. Every figure traces to a source document, a user and a timestamp.

Worth saying plainly: e-invoicing obligations in the UAE are being introduced in phases, and the applicable date depends on the entity. We will confirm Aramam's position with you in discovery — but a system that produces structured invoices natively is a far easier place to comply from than manual entry into a desktop ledger.

The cloud kitchen, from day one

The hardest time to put a system in is after the new site opens. Doing it now means the cloud kitchen launches onto a platform that already works.

PHOTO PLACEHOLDER
cloud kitchen / central production

A new site is configuration, not a project

Add a location, assign users, inherit the item master and the approval rules. Days, not months.

Central production, distributed outlets

Produce in the cloud kitchen, transfer to outlets on transfer orders, and keep one accurate stock position across both.

Delivery channels tracked separately

Aggregator and direct-delivery revenue posted to their own dimensions, with commission and settlement visible.

Channel-level profitability

See what a dish actually earns on delivery versus dine-in, once commission and packaging are in the cost.

Licensing follows users, not sites

Opening another location does not multiply the licence cost — you add the users who need access.

One process, repeated

The SOPs, approvals and reports built in this project apply to the next site unchanged.

Product capability + Gerab expertise = your solution

Microsoft supplies a world-class platform. What makes it work at Aramam is the configuration, the recipes, the integration and the training around it.

YOUR SOLUTION

A working system configured to your outlets, your menu, your suppliers and your approval rules.

GERAB CONSULTING, CONFIGURATION & INDUSTRY EXPERTISE

Process design, POS integration, recipe and data migration, training, and support after go-live.

PRODUCT CAPABILITY — MICROSOFT DYNAMICS 365 BUSINESS CENTRAL

Finance, inventory, purchasing, production, security and reporting — maintained by Microsoft.

An indicative implementation roadmap

Sequenced so the highest-pain areas — stock control and the finance close — come under control first. Durations are confirmed after discovery.

Indicative only. The sequence and durations are confirmed in the discovery phase and agreed with you before we commit to a plan.

What each side brings

Implementations fail on availability, not on software. Being explicit about this now is the cheapest insurance in the project.

Gerab delivers

- Solution design and system configuration
- POS and aggregator integration build
- Data migration tooling and load
- Recipe and costing setup with your chefs
- Power BI dashboards and the MIS pack
- Role-based training and SOP documentation
- Go-live cutover, hypercare and ongoing AMS

Aramam provides

- An executive sponsor who can unblock decisions
- A process owner each for operations, store and finance
- Cleaned item, supplier and recipe data in our templates
- Access to the POS vendor for the integration
- Availability of outlet and store staff for UAT and training
- Timely sign-off at each phase gate
- Agreement on the cutover weekend

How Business Central is licensed

Named users on a monthly subscription, plus a one-time implementation and an annual support agreement. No server hardware, no perpetual licence.

Essentials

For most of the group

- Finance and GL
- Inventory and locations
- Purchasing and approvals
- Sales and receivables
- Project and job costing
- Warehouse basics

Premium

Where production is needed

- Everything in Essentials
- Manufacturing and production orders
- Assembly and recipe BOMs
- Service management
- Recommended for kitchen production users

Team Members

For light, read-mostly users

- Read all data
- Approve and enter time
- Update existing records
- Suited to outlet managers who consume reports
- Lowest cost per user

Commercial proposal: user counts, licence mix, implementation fee and annual support are set out in the separate commercial document.
[Insert summary figure or leave for the commercial meeting.]

Why Business Central, and why Gerab

Why Business Central

PLATFORM STRENGTHS

- Microsoft's ERP for mid-sized business — proven, current, and not going anywhere
- Finance, stock, purchasing and production in one data model
- Multi-location and multi-company are standard capability
- Native Excel, Outlook, Teams and Power BI integration
- Cloud-delivered: no servers, automatic updates, Microsoft SLA
- Structured invoicing and a clean audit trail for UAE compliance
- Wide skills availability — you are not locked to one consultant

Why Gerab System Solutions

DELIVERY STRENGTHS

- Microsoft partner delivering Dynamics 365 and the wider Microsoft stack
- UAE-based consultants who understand local compliance and local operations
- Experience across construction, trading, manufacturing and services groups
- Integration capability — POS, aggregators and third-party systems
- One partner for licensing, implementation, BI and ongoing support
- Power BI and SharePoint capability to extend the platform later
- A support desk after go-live, not a handover email

NEXT STEPS

Let the detail decide it.

Before anyone signs anything, we would rather walk the floor. Two days with one outlet, the central store and the finance desk will tell us — and you — exactly what this project is.

01

Discovery walkthrough

Half a day at one outlet and the central store, half a day with finance. No cost, no obligation.

02

Scoped proposal

A fixed scope, a phased plan and a commercial proposal built on what we saw — not on assumptions.

03

Tailored demo

Business Central shown with your menu, your outlets and your recipes — not a generic demo dataset.
